AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) A method of operating a computer system to provide a user interface to a data storage system, said computer system including a rule store storing one or more rules, said method comprising the steps:

providing a user interface to said rule store enabling user configuration of said rule store with one or more rules, each rule <u>identifying</u> including information relating to a handler program, said handler program being associated with one or more user requirements and being operable to interact with said data storage system in accordance with said user requirements;

receiving a request detailing one or more user requirements; and responsive to receipt of said request:

- a) <u>selecting a handler program by</u> searching said rule store for a rule <u>specifying one or more handler programs given</u> associating said one or more user requirements-of said received request with a handler program;
- b) running said <u>selected</u> handler program to interact with said data storage system.
- 2. (Original) A method according to claim 1, wherein said information relating to a handler program comprises the name and the location of the handler program.
- 3. (Original) A method according to claim 1, wherein said information relating to a handler program comprises the handler program itself.

- 4. (Previously Presented) A method according to claim 1 further comprising the step of running a default handler program to interact with said data storage system if no rule associating a handler program with the one or more user requirements of said received request is found.
- 5. (Previously Presented) A method according to claim 1, wherein said rule store user interface provision step comprises storing a rule associating predetermined user requirements with a handler program executable to interact with said rule store to introduce a further rule contained within said request into said rule store.
- 6. (Original) A method according to claim 5 wherein said further rule replaces an existing rule.
- 7. (Previously Presented) A method according to claim 1 wherein said request comprises a request to store said handler program.
- 8. (Previously Presented) A method according to claim 7 wherein said handler program comprises a default handler program.
- 9. (Original) A method according to claim 1 wherein said request contains a rule associating a handler program with the user requirements of said received request.
- 10. (Previously Presented) A method according to claim 1 wherein said rules are expressed in the form of text.

- 11. (Original) A method according to claim 10 wherein said rules are reparable using a text editor.
- 12. (Previously Presented) A method according to claim 1 wherein said rules are indicative of a time after which said rules should no longer be applied.
- 13. (Previously Presented) A method according to claim 1 wherein said data storage system comprises a plurality of databases and wherein each one of said plurality of databases has a different data handler
- 14. (Original) A method according to claim 13 wherein said databases are of a different format to each other.
- 15. (Previously Presented) A method according to claim 1 wherein said rule store user interface is restricted to a certain class of user.
- 16. (Previously Presented) A method according to claim 1 wherein the data storage system user interface is available to a different set of users from those able to modify said rules in said rule store.
- 17. (Previously Presented) A method according to claim 1 wherein said computer system comprises a plurality of computers in communication with one another, the handler programs being run on a different computer to the one that receives said request.

- 18. (Previously Presented) A method according to claim 1 wherein said computer system comprises a plurality of computers in communication with one another, the rule store being on a different computer to the one that receives said request.
- 19. (Currently Amended) A computer system operable to provide a user interface to a data storage system, said computer system comprising:
 - a data storage system;
 - a rule store:

a user interface to said rule store operable to enable a user to configure said rule store with one or more rules, wherein each rule <u>identifies</u> includes information relating to a handler program, said handler program being associated with one or more user requirements and being operable to interact with said data storage system in accordance with said user requirements;

request receiving means arranged in operation to receive a request detailing one or more user requirements;

rule store searching means operable to <u>select a handler program by searching</u> search-said rule store for a rule <u>that specifies a handler program given</u> associating-said one or more user requirements of said received <u>request</u>; and <u>request with a handler program</u>;

handler program running means operable to run said <u>selected</u> handler program to interact with said data storage system.

20. (Previously Presented) A digital data carrier carrying a program of instructions executable by processing apparatus to perform the method steps as set out in claim 1.

21. (Currently Amended) A method of operating a computer system to provide a user interface to a data storage system, said computer system including a rule store storing one or more rules, each rule associating a handler program with one or more request characteristics, said method comprising:

providing a user interface to said rule store enabling the modification of said rules in said rule store;

receiving a request having one or more request characteristics; responsive to the receipt of said request:

- a) finding a rule in said rule store <u>that specifies</u> associating a handler program with the one or more characteristics of said received request; and
- b) running said <u>specified</u> handler program to interact with said data storage system.
- 22. (Currently Amended) A method according to claim 21 further comprising storing one or more rules in said rule store.
- 23. (Original) A computer system for providing a user interface to a data storage system said computer system comprising:

a data storage system;

storing means arranged in operation to store one or more rules, each rule associating a handler program with one or more request characteristics;

means arranged in operation to provide a user interface to said rule store enabling the modification of said rules in said rule store;

receiving means arranged in operation to receive a request having one or more request characteristics:

finding means arranged in operation to find a rule in said rule store <u>that specifies</u> associating a handler program with the one or more characteristics of said received request; and

running means arranged in operation to run said <u>specified</u> handler program to interact with said data storage system.
